SUPPORT FOR PROFESSIONALS IN PRUNING AND MANAGING VINEYARDS AND TREES USING AGROECOLOGICAL PRACTICES

Structure : Architect of Life

Difficulté : facile

As a "living architect," we train and support professionals in the pruning and management of grapevines and trees.

Our organization advocates for and develops an approach to agricultural practices that is directly grounded in the physiological and ecological functioning of woody plants, in harmony with the terroir.

The vine, like the winegrower, needs time to evolve, build, and test a new system.

Long-term support thus remains the best way to ensure the gradual implementation of a new vineyard management strategy across the entire estate.

A multi-step process

1. Training

Taking a general training course is an essential first step toward understanding the principles of sound and sustainable vineyard management.

It provides a clear understanding of best and worst practices.

2. Audit

A crucial collaborative phase to properly identify the issues through discussions and several on-site assessments.

The goal is to define specific objectives and establish a properly contextualized action plan.

3. Implementation

We provide step-by-step support to each member of your team in carrying out technical tasks throughout the season.

Work organization and adaptability to unforeseen events, particularly weather-related ones, will shape the implementation of strategies.

4. Review

We'll come back to see you to summarize the results achieved and discuss future prospects.
