Guide: How to Build Your Own Compost Bin

Structure : ADEME

Difficulté : facile

A compost bin isn't essential for the composting process to work well, but it does offer many advantages

? aesthetics

– clean access – limited or no access for animals

– better use of space since the pile can be taller and more compact

In a wooden composter, the waste will tend to dry out more easily than in a plastic composter. Since dry waste no longer decomposes, you should monitor the moisture content of the composted waste and make the necessary adjustments at least twice a year by opening and turning the different layers of waste. At that time, be careful not to mix young compost with

mature or semi-mature compost.

Outillage et Fournitures

Scie, marteau, clous de 5 ou 6 cm en fonction de l'e?paisseur de vos poteaux et de vos planches, tenaille ou pied de biche, perceuse ou vilebrequin, tige filete?e de 8 mm (1m suffit), 12 e?crous et 12 rondelles, une scie a? me?tal, double me?tre, e?querre.
