A GROUNDWATER RECHARGE SYSTEM THAT COLLECTS AND STORES RAINWATER DURING THE MONSOON SEASON

Structure : Bhungroo

Difficulté : facile

Bhungroo is an innovative and sustainable agricultural technology developed to combat water scarcity in arid regions. It is a groundwater recharge system that captures and stores rainwater during the monsoon season. This stored water is then channeled into the ground, which helps recharge aquifers and prevent soil saturation during heavy rains. Bhungroo not only conserves water but also facilitates year-round irrigation, allowing farmers to grow crops during dry seasons. This technology empowers rural communities, particularly women, by improving agricultural productivity, reducing dependence on irregular rainfall, and promoting climate resilience. Bhungroo represents a crucial solution for addressing water scarcity and ensuring food security in vulnerable regions.
